Speed vs. size table: Predict the trip distance for a given speed. Speed (m/s) Sporting the alternative title of ‘Velocity’, the app is an extremely useful application that goes the extra mile. If you are a professional that works on the roads, the app can help you to track the distance you travel for the day as well as predict the distance you can expect to cover for a given speed. Instructions are, however, slightly lacking. To start, you need to open the app's window, which has a minimalististic approach. You just need to log in with your chosen profile and you're presented with a neat looking graph as shown in the screenshot below. The center column represents the distance you are traveling and the left and the right margins contain the remaining distance for the day and the whole month. This simple graph shows the distance you can expect to travel during your working day. The right margin, which represents the distance you expect to cover for the entire month, is broken down into months, days and hours, whereas the left margin presents the exact distance you have covered for the day itself. The top margin contains the total number of kilometers you've traveled during the day and is broken down into hours, whereas the bottom offers you, among other statistics, the total number of kilometers you have traveled since you've opened the app. Speed vs. size table: The distance per hour is shown in kilometers. Speed (m/s) The left side of the table displays the various travel speeds and the respective distances are added up to provide you with a figure showing the total number of kilometers you expect to cover during your working day. For example, we have a car traveling at a speed of 100 km/h. It will cover a distance of 15200 km during the day in 5 hours and 30 minutes. The right side of the table displays the average speed for the respective day and the total number of kilometers covered for each month. You can, of course, add the two numbers and it shows you the total number of kilometers you expect to cover for the month. In the same manner, the very left margin summarizes the number of kilometers traveled during each hour, while the top column is utilized to add up the total numbers of kilometers you expect to reach during the day. Speed vs. size table: Distance for a given speed per hour Speed (m/s) Distance (Km)

The overall speed of an animation. Active Time: The active time is the sum of the total duration for all frames multiplied by the frame rate. In addition to the frames duration, the time can vary between zero (inactive) and the total duration. In the event that the time equals the duration, then the frame is completely in action. Pause Time: This specifies a frame for which the animation starts to be inactive. The Pause Time is based on the Active Time and has no relation with the Inactive Time. Frames: The total number of frames in the animation. Frame Rate: The overall speed of the animation. Inactive Time: This is the total duration of the animation's inactivity, or the period of time from the beginning of the animation to the start of its inactive period. V - V Amount to be added to the beginning of the animation's total duration when a key frame has been reached. Auto Interpolate: This option is activated when the framerate is constant. Interpolating animation while the framerate is not constant happens through exponential and linear interpolation methods. Linear: Takes a smooth increase in duration. Exponential: Takes an abrupt increase in duration. Auto Timing: This is activated when the framerate is variable. The timing of an animation is defined through the following: the time from an active frame until the next inactive frame and the time from an inactive frame until the next active frame. Max Delay: The maximum delay time in ms the animation can be delayed from its active frame. Min Delay: The minimum delay time in ms the animation can be delayed from its active frame. Max Delay Timing: Specifies if the Max Delay Time can be active or inactive within a frame. Min Delay Timing: Specifies if the Min Delay Time can be active or inactive within a frame. Fidelity: This property value is set depending on the framerate of the animation. If the framerate is lower than 1 (fps), this property value set to 0.1. If the framerate is lower than 4 (fps), this property value set to 0.1. If the framerate is lower than 10 (fps), this property value set to 0.2. If the framerate is lower than 20 (fps), this property value set to 0.5. If the framerate is lower than 40 (fps), this property
