Component-based architecture Autodesk offers several technical approaches for extending AutoCAD, including the use of its component-based architecture. To create your own subroutines or components for use in AutoCAD, you must choose a programming language. A few languages that are commonly used to create AutoCAD components include: Visual Basic (VB), Visual LISP, C++, C#, C++/CLI, Java, and JavaScript. The ObjectARX Component Studio tools offer a graphical component development tool for visual developers, like those who create UML class diagrams. AutoLISP AutoLISP is a powerful programming language and is a registered trademark of Autodesk, Inc. that is integrated into the current versions of AutoCAD. AutoLISP has many data types and functions. The functions are used to manipulate data in a drawing. The language allows a user to define user-defined objects and functions that can be saved, executed, and redefined. Once saved, they can be reused within a drawing. With the use of dynamic linking, AutoLISP objects can be called from other AutoLISP objects. There are two primary ways to create new objects in AutoLISP: by using the AutoLISP macros or by using a workbench. AutoLISP provides a number of data types for storing and manipulating objects, such as: Strings Lists Lists of lists Strings of lists Numbers Booleans Variables Paths Paths of paths Object AutoLISP defines built-in functions that can be used to manipulate AutoLISP objects, such as: functions to open, read, write, and close files functions to copy objects functions to move objects functions to check if objects are loaded Currently, the AutoLISP language offers an indirect method of communication with the drawing environment. Instead of being able to call methods on objects, AutoLISP uses macros to call functions in external scripts and the API language. Macros are pieces of code written by a programmer and that can be called from within an AutoLISP program. Macros can be used to extend AutoLISP's functions and can allow a
