. . . .Draft genome sequence of a coastal bacterium, *Oceanibulbus brasiliensis* sp. nov., with a powerful biosynthesis capability for 1,4-diols. *Oceanibulbus brasiliensis* sp. nov. strain Q(T) (= KCTC 23539(T) = DSM 23185(T)) is a marine bacterium isolated from a seawater sample collected from the coast of Nankai, Japan. Cells of *O. brasiliensis* sp. nov. were Gram-stain-positive, non-spore-forming, non-motile, and rod-shaped. Phylogenetic analyses based on the 16S rRNA gene sequence revealed that strain Q(T) belonged to the family Anaerobiaceae, phylum Firmicutes, class Clostridia. The major cellular fatty acids of strain Q(T) were iso- and anteiso-C15 : 0, iso-C16 : 0, iso-C17 : 0, iso-C15 : 0 3-OH and iso-C17 : 0 3-OH. The G+C

content of the genomic DNA of strain Q(T) was 34.7 mol%, and the major respiratory quinone was MK-8. On the basis of the data of the polyphasic analyses, *O. brasiliensis* sp. nov. is a novel species of the genus *Oceanibulbus* and its type strain, Q(T) (= DSM 23185(T) = KCTC 23539(T)).

Q: Can I process a group of files with "find" in findutils? I would like to process a group of files with "find" in "findutils". Here is the command I used: `find /home/user/incoming/ -name '*.tar.bz2' -exec tar -jcf {} my.tar.bz2 \;` This gives an error: `tar: appending to unknown file my.tar.bz2` The command works fine when applied to a single file, but not to a group of files.

A: `-exec` is a command-line shell operator that takes a shell script and run it for every file, which isn't ideal for non-shell applications that you can't easily write a shell script for.
