The resolution, the sampling frequency, and the range of the analog-to-digital converter depend on its intended use. For example, if the analog-to-digital converter is intended for a system in which the converter must sample with high resolution, a sample rate of one million samples per second (MHz) may be required. If the analog-to-digital converter is intended for a system in which the converter must sample with low resolution and accept a wide range of analog signals, a sample rate of only about 50 to 100 samples per second may be required. FIG. 1 illustrates an example of a prior art analog-to-digital converter (ADC) 10 that includes an input stage 12, a reference input stage 14, and an output stage 16. The input stage 12 includes an input terminal 18, a sample and hold (S/H) circuit 20, and an inverting amplifier 22. The input terminal 18 receives an analog input signal V.sub.in from some source (not shown) and passes it to the S/H circuit 20. The S/H circuit 20 samples the analog input signal, and the resulting sample is output through an output terminal 24. The reference input stage 14 includes a reference circuit 26 and a bandgap reference circuit 28. The reference circuit 26 includes an operational amplifier 32, a resistor 34, and a transistor 36. An output signal V.sub.e is generated from the resistance of the resistor 34 and the voltage drop across the transistor 36. The inverting amplifier 22 performs an amplification of the output signal V.sub.e of the reference circuit 26. The output stage 16 includes a
